

GALVANIZED TANK RINGS

- Elevates tank preventing it from sitting in standing water
- Increases the life of the tank's bottom
- Galvanized coating prevents rust and corrosion
- Easy installation
- Optional bottom saver breaks down the electric currents need for corrosion to take place.

With the high cost of tanks, spending a few more dollars to protect your investment makes perfect sense. Galvanized Tank Rings elevate the tank off of the ground preventing it from sitting in standing water which will increase the life of the tank's bottom. The optional Bottom Saver stops corrosion by breaking the electric currents needed for corrosion to take place. You also get the piece of mind that a pinhole leak in the tank cannot go undetected. The built-in sump (optional) allows you to clean the tank without putting fluids on the ground. The Bottom Saver is fully reusable and guaranteed for the life of the tank against chemical and ultraviolet attack.
